

### Abstract of the Disclosure

09916497.073001

A system for performing transactions of securities is composed of a customer terminal, a securities sales system, a securities transaction system, an account management system, and a network. The customer sends transaction order information and account indication information to the securities sales system. The transaction order information indicates a customer-requested transaction. The account indication information being indicates a customer account for which the customer-requested transaction is to be requested. The securities sales system transfers the transaction order information to the securities transaction system. The securities transaction system performs a transaction in response to the transaction order information, and sends transaction result information indicative of the performed transaction to the securities sales system. The securities sales system produces settlement information indicative of settlement with respect to the performed transaction in response to the transaction result information and the account indication information. The account management system settles the customer account in response to the settlement information.
